

- 1) I would like to create a database for storing data on different aquarium fish. There are a lot of aquarium fish but I like to do research on a lot of different kinds when I am planning a fish tank so I can see if certain fish are compatible with other fish (are they too big, are they aggressive, can they easily exist in the same water etc.).
- 2) Some example entities:
 - a. Species name: Honey Gourami, Betta fish, Corydoras Catfish.
 - b. Family: Cichlid, Gourami, Characidae
 - c. Water type: Warm Freshwater, Cold Freshwater, Cold Saltwater
 - d. Behavior: Timid, Peaceful, Aggressive
 - e. *For complexity I could also introduce the Fish tank entity which would be to track minimum tank sizes. Examples would be different sizes like a 5-gallon or 50-gallon.
 - f. Fish could be described by their Scientific name which would allow you to search based on Genus, family, or species.
- 3) I want this database to be able to pull up the general information on certain fish. Ideally it could be used to help with sorting fish for the purposes of compatibility (searching for only warm freshwater fish so I don't look to put saltwater fish with them as an example). It would also be nice to find the fish that I'm interested in based on their family (so I could plan a cichlid only tank or something like that).
